We present to you a wall-mounted typhlographic board with vivid colors for people with visual disabilities.

<https://www.youtube.com/watch?v=XKZubNmB9YU>

Typhlography boards are special boards designed based on the sense of touch. Our board also has convex elements and surfaces in vivid colors for visually impaired people.

They allow blind and visually impaired people to move safely and easily within the space of a given building. They are used in many public places: museums, art galleries, parks and hospitals. They enable blind people to access information that would otherwise be completely inaccessible to them. They make the building accessible to people with visual disabilities.

We design our boards in such a way that everyone can use them. A blind person uses Braille inscriptions and convex elements, thanks to which he or she can find the right room or, for example, the exit from the building by touch.

Sighted people will appreciate the clear, minimalist design that will clearly show them the way to their destination.

The board we offer you includes, among others: rooms, routes and other important elements of the building tactilely reproduced on the board using convex, tactile elements, descriptions in Braille made using special balls, as well as a simplified and clear legend.

The most important features of our boards are simplicity, readability and a clear message. The project is designed to describe a given space as precisely as possible and enable a blind person to explore it so that he or she can move around the facility completely independently. We want our boards to contain only the most necessary information and be as readable as possible.

The product is very visually attractive and eye-catching. It also helps sighted people find their way around the building. It can be mounted outside and inside the building. We recommend installing it close to the entrance.

The inscriptions in the Braille system are made of transparent balls, thanks to which they shimmer nicely in the sun and attract attention, and at the

same time are pleasant to the touch for people who read Braille.
